

**Dear Mom and Dad,**

My class researched PA rocks and I chose Anthracite Coal.

It looks black and shiny and it looks very smooth.

It can be found in Carbon County.

It is made from the remains of wood, bark, and leaves, but it is not a sedimentary rock. It is a metamorphic rock because it was once another rock. Before Anthracite Coal was coal, it was peat and then the peat lithified into Anthracite Coal.

I chose this rock because it looked shiny and I thought it had a lot of interesting facts about it.

**Love,**

Jason
